MOBILE APP

Revised graphical user interface

The release of version 02.00 of Ipetronik's (Germany) IpeMotion app provides a revised graphical user interface. The app features graphical and alphanumerical data visualization of CAN data.

WITH THIS UPDATE, particular emphasis was laid on customer requirements like quickly displaying all channels at a glance, exporting this view as PDF, and entering notes to events during test drives. Version 02.00 of the app will be available from the Google Play Store from July 2014.

Core functions of the app are fast and easy visualization of measurement data, connection of CAN interfaces to Android devices, display functions for Ipetronik data loggers, and high data security by directly storing data on the Ipehub2 module.
