CANopen configuration tool enables the configuration of Trafags pressure transmitter CMP 8270 via USB (Photo: Trafag)

Configuration of CANopen devices is for non-experts a difficult task. Common software is geared towards experts with a lot of background knowledge and routine in programming such devices. Neither the software user interface nor hardware like connectors and adapter cards are a comfortable solution for occasional users.

The CMP CANopen configuration tool, developed and produced for Trafag CMP 8270 CANopen pressure transmitters, is a solution for this, said the company. The tool comprises a software interface and a USB-to-CANopen dongle.

The product allows configuration of all CANopen parameters and access to the complete object dictionary. Live display of the actual measurements of pressure and temperature and an integrated logger with export function offers easy monitoring of the CANopen communication. The product comes with an integrated data-logger. Its system requirements are: Windows 7, Windows 8, Windows 10, USB 2.0 or higher. The product can be seen at the [Hannover Messe](#) 2017 in hall 11, stand F37.
