

With WLAN connectivity

Epec (Finland) has released a variant of its 6107 display unit with built-in WLAN wireless communication. CANopen and J1939 support are provided.

The WLAN implementation supports both client and access point operation for direct D2D communication. The product is a solution for heavy-duty applications like mining machines, excavators, agricultural machinery, wheel loaders, etc. The programmable graphical user interface provides an opportunity to maximize machine usability and efficiency, while staying user friendly, said the company.

The product is equipped with two CAN interfaces. These interfaces allow the machine to be connected to higher-level information systems, such as databases for monitoring production. Support for CANopen and J1939 are also provided. The unit comes with a flash of 4 GiB and RAM of 1034 MiB.
