

PUMPS PC SOFTWARE

## Vacuum management

**Lemcom Manager by Coval is a PC software for mini-vacuum pumps with fieldbus communication such as CANopen.**

(Source: Coval)

Specially developed with vacuum handling applications in mind, Lemcom Manager is a PC software package which allows, in just a few clicks, to remotely setup and configure Lemcom vacuum generators as well as run diagnostics.

The software is packed with numerous functions such as the import/export of parameters, vacuum cycle analysis, alarm, and operation cycle monitoring, configuration help or even embedded firmware updating. The application allows all Lemcom mini pumps to be controlled remotely over the network either by the end user or by the company's technical support teams.

The series of mini-vacuum pumps, combined with the PC tool, offer the first global solution for vacuum gripping via fieldbuses such as CANopen and Ethernet (Profinet, Ethernet/IP).
